■ 焊接 Weldability

双相不锈钢焊接最重要的是维持热影响区内的相平衡，避免析出相的产生。

双相不锈钢可使用奥氏体不锈钢所使用的大部分焊接方法进行焊接：手工电弧焊（SMAW）、惰性气体保护钨级电弧焊TIG（GTAW）、惰性气体保护金属级电弧焊MIG（GMAW）、药芯焊丝电弧焊（FCAW）、埋弧焊（SAW）等。

■ 焊接基本规则：

- 焊前不需要热处理；
- 焊接层间温度≤150°C，对于2507而言温度≤100°C；
- 需要使用双相不锈钢专用焊材；
- 热输入应考虑双相不锈钢成分和厚度。

Keeping phases balance in heat affected zone(HAZ) is the most important for duplex stainless steel. It can successfully avoid the precipitated phases.

The most of welding methods for austenitic stainless steels are suitable to the duplex stainless steels. Such as SMAW, TIG (GTAW), MIG (GMAW), (FCAW) and (SAW).

General rules for welding

No pre-heating of welding.

Weld interpass temperature≤150°C, Temperature for 2507≤100°C.

Special welding material for duplex stainless steel are needed.

Heat input varies with the composition and thickness of duplex stainless steels.

■ 加工与成型 Processing and molding

■ 热加工温度和热处理温度 (°C) hot working and heat treatment temperature

	2101	2304	2205	2507
热加工温度 hot working temperature	900~1100	900~1100	950~1150	1020~1200
热处理温度 heat treatment temperature	1020~1080	1020~1080	1020~1100	1050~1120

由于双相不锈钢容易产生析出相导致钢材脆化，从而影响其使用性能。 σ 相等金属间相的形成温度范围为600~950°C，而铁素体的转变发生范围为350~525°C (475°C脆性)。因此，双相不锈钢应避免在这些温度下使用，一般的使用温度不要超过250°C。

对于2101双相不锈钢而言，由于其不含钼，其对 σ 相等金属间相析出并不敏感，

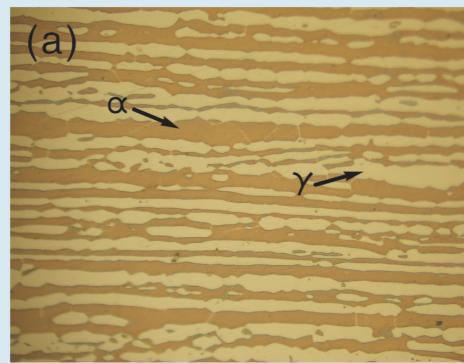

The precipitated phase in duplex stainless steel may result in the embrittlement, therefore, the application performances would be affected.

The formation temperature range of σ intermetallic phases is about 600~950°C. For ferritic stainless steel, the transformation temperature is between 350~525°C (475°C brittleness). For this reason, the application temperature for duplex stainless steel should be below 250°C.

Differing from 2507 and 2205, 2101 duplex stainless steel is not sensitive to intermetallic phases precipitation and easily be controlled in heat treating and welding.

■ 普通金相与析出相金相对比图

metallographic microscopes for duplex stainless steel(a: no σ phase, b: with σ phase)

■ 冷成型性cold forming ability

与奥氏体不锈钢相比，双相不锈钢强度更高，成型时所需力度比奥氏体不锈钢要大。不过由于降低了材料厚度，影响比预期的要小。由于强度高，在弯曲时，其回弹会比较大。

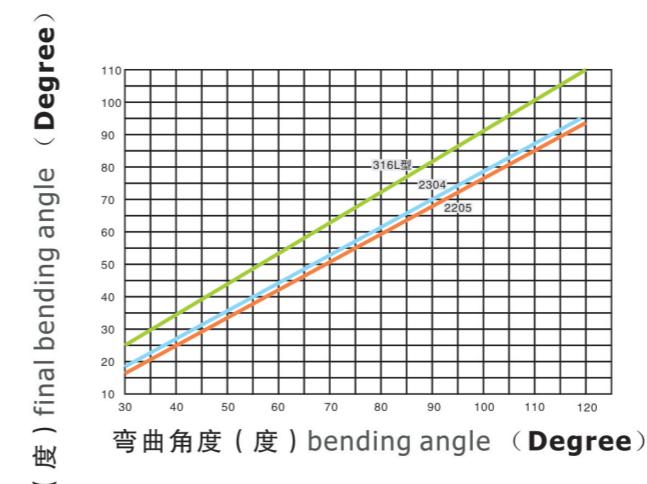

Compared with the austenitic stainless steel, duplex stainless steel has higher strength and need large force for molding. Because of material thickness reducing, the influence of this strength is much smaller expectation. The rebound effects will be obvious during bending.
